
Major Project

Artefact: Assessment Brief

Introduction

You are required to deliver a major project as part of your master's degree; in the form of research and/or innovation relating to your specialism, encompassing empirical and/or practice-based research. Individually, you will explore a field that interests you, and for which there is a clearly identified need.

The higher-level aim for this module is to support you on your journey through a research and innovation project that has the potential to contribute new knowledge in a chosen field of study, produce an artefact that is of publishable quality, and develop your personal portfolio in a way that supports your future aspirations. If your project is particularly strong, there may be scope for taking it forward for publication in academic conferences or seeking business start-up funding.

For this module, you are required to complete one assignment, composed of two parts: a **Proposal**, and an **Artefact**.

Note that this module is worth 60 credits, which is twice as many credits as your previous modules. As such the expectation is that the amount of work you put into this module is roughly double that of previous modules.

Project Scope

The brief for this project is intentionally open-ended. You will be assigned a supervisor, a member of the academic team whose role is to mentor you through the project. With your supervisor's aid, you will refine your proposal and then deliver your project.

Your project may be:

- A standalone individual project, where you undertake all of the work yourself.
- An individual contribution to a group project with other GAM708 students.
 - Note that each member of the group must have a well-defined contribution to the overall project.
- An individual contribution to an external project. Some students at this stage of their studies may be working as interns or part-time employees in the industry, as members of teams under incubation schemes such as Transfuzer, or collaborating with students from other courses. In this case, you may leverage this work as the basis for your major project as long as:
 - You are able to fulfil the requirements of this assignment.
 - You are making a well-defined contribution to the external project.
 - You obtain permission from your external partners, in particular addressing any issues around intellectual property or commercially sensitive information.

The main aim of this project is to produce an artefact. The definition of "artefact" is intentionally open-ended, but it should be a physical or digital work which satisfies a clearly identified need for an intended audience. The artefact types listed below each carry specific submission requirements in addition to the standard components; these are set out in the Artefact section of this brief.

- **Software product:** for example, a game, an app, or a reusable software component. This could be a marketable product, or a demo/prototype.
- **Written dissertation:** a long-form piece of academic writing, based on an in-depth review of relevant academic literature and possibly a piece of primary research, making a contribution to knowledge in a particular specialist field.
- **Portfolio of creative work:** for example, a portfolio of high-quality art assets, presented professionally and coherently, demonstrating your artistic process.
- **Anything else:** the brief is intentionally open-ended, and you are welcome to discuss with your supervisor what might constitute a suitable artefact.

Developing your concept

To help you conceive a topic for your project, try to:

1. Review the state-of-the-art from your industry and/or academic point of view.
2. Derive a key question or problem from the review to motivate your work.

Discuss this topic with your supervisor in the timetabled supervision meetings. You will receive informal feedback on your proposal, which you should use to iterate upon your ideas. From there, carry out an extensive research and innovation project using industry-standard project management principles and techniques. You will receive regular informal feedback about your work through meetings with your supervisor. Iteratively improve the artefact and show it to your supervisor in a timetabled meeting. As the requirements for the artefact will vary by project, consult with your supervisor to verify whether the artefact is adequate for the desired purpose.

Project Proposal (20%)

The proposal is worth 20% of the overall marks for this module. It is assessed individually on a criterion basis, according to the rubric at the end of this document.

The proposal has two components: a presentation and a proposal form. Both are submitted to Learning Space and assessed together.

Part A: Proposal Presentation

Prepare a 10-minute presentation that addresses the following questions:

1. What is the context of your project?
2. How does it fit into your specific field?
3. What are the key results, from academic literature and/or from state-of-the-art, upon which your project will be built?
4. What are the key research questions that you will seek to answer in your project?
5. What will be the final format of your artefact?
6. Who is the audience for your artefact, and what need does it fulfil for them?
7. What are the key legal, social, ethical, and/or professional issues associated with your project?

You will receive immediate informal feedback from supervisors in the session, and formal written feedback within three weeks of the timetabled proposal session. Be prepared to defend your proposal in Q&A.

Part B: Proposal Form

Submit a completed Proposal Form to Learning Space at the time of your presentation. The form is a short structured document that records the key commitments made in your proposal and provides the basis for your supervisor's formal feedback. It covers the following:

- Research question and project title
- Proposed artefact format and intended audience
- Summary of methodology and key academic/practice references
- Ethics considerations and confirmation of whether a full ethics application is required
- Project plan: key milestones, potential blockers, and contingency
- **Process documentation method:** the approach you will use to document your development process throughout the module (e.g. blog, dev log, sketchbook, version control repository, design portfolio). This must be appropriate to your artefact type and approved by your supervisor.

The Proposal Form is available as a separate document on Learning Space. Your supervisor's written feedback on the proposal will confirm whether your proposed process documentation method is appropriate. This confirmation serves as the record of approval; no separate sign-off is required.

Artefact (80%)

Your artefact is worth 80% of the overall marks for this module. It is assessed as a single, integrated submission comprising two mandatory components: the artefact itself and an accompanying reflective video. Assessment is conducted primarily against the artefact; the reflective video contextualises the work and informs feedback, but does not carry a separate grade.

All artefacts are assessed against the shared criteria in the Artefact Marking Rubric below. You must evidence an iterative process and document your critical thinking throughout development. The assessor must be able to identify how your project has developed from its initial concept, through a series of prototypes or iterations, to the final deliverable. Your process documentation — the method confirmed at proposal stage — is the primary means by which this evidence is made visible, and should be included in or clearly linked from your artefact submission.

Part A: Artefact Submission

Upload a .zip file containing the final version of your artefact, any assets or dependencies, and your process documentation (or a clearly labelled link to it) to Learning Space.

Include also a brief updated contextual review or annotated bibliography (no prescribed length or format) documenting the literature, creative precedent, and field discourse that informed your project through development. This need not repeat your proposal in full: it should reflect how your contextual awareness developed as the project progressed.

Learning Space will only accept a single .zip file with a maximum size of 1 gigabyte. If your file is too large, you may be permitted to submit a link to materials hosted elsewhere: for example, a repository on the Games Academy Git server, your own GitHub, or a shared folder on the university's OneDrive. Discuss this with your supervisor and/or the module leader prior to submission.

If the nature of your artefact requires special handling, this will be discussed with your supervisor.

IMPORTANT: Your repository or link must be valid and accessible until your final grade is released and cannot be modified after the final deadline. Your grade may be invalidated or counted as a non-submission if files have been modified or are no longer accessible after the deadline.

Part B: Reflective Video

Upload a single video file, or an unlisted link to a hosted video, to Learning Space alongside your artefact. The reflective video allows you to explain and contextualise your work in your own voice, and provides the primary basis for your assessor's written feedback.

The video is a mandatory component of the submission. A submission without a reflective video will be treated as incomplete.

Your reflective video should address the following questions:

1. What is the context and high-level concept of your project?
2. How did you approach the development of the project?
3. What answers did you find to the key research questions you set out to explore?
4. Does your artefact fulfil the need you identified for your target audience? Why, or why not?
5. What are the wider implications and value of your work?
6. What potential is there for future work?

The standard video length is 10 minutes. Depending on your artefact type, additional content may be expected within or alongside the video — see the artefact-type requirements below.

The reflective video replaces the previously timetabled viva presentation. There is no live presentation or Q&A session for the artefact component. Formal written feedback will be returned within 15 working days of the submission deadline.

Artefact-type submission requirements

In addition to the standard components above, the following additional requirements apply depending on your artefact type. Where your artefact does not fit neatly into one of these categories, discuss expectations with your supervisor.

Software product (game, app, tool, or prototype)

- Include a README or equivalent document specifying system requirements and instructions for running the build.
- Include a walkthrough video or recorded gameplay footage (approximately 5 minutes) demonstrating the core features of the artefact. This may be incorporated into the reflective video or submitted as a separate file.
- Where a working build cannot be reliably distributed to assessors (e.g. hardware-dependent builds, live-service components, multiplayer-only experiences), a recorded demonstration is required and should be flagged to your supervisor in advance.

Written dissertation

- Submit as a single PDF or Word document, formatted to the conventions of your discipline.
- No additional video content beyond the standard 10-minute reflective video is required.
- Ensure that all references are complete and formatted consistently using an appropriate citation convention.

Portfolio of creative work

- Present the portfolio as a coherent, professionally formatted document or dedicated online portfolio, with accompanying process work where relevant.
- Include a walkthrough video (approximately 5 minutes) guiding the assessor through the portfolio and explaining key creative decisions. This may be incorporated into the reflective video or submitted separately.

Other artefact types

- Discuss with your supervisor what additional submission materials are appropriate. Confirm this at proposal stage so that expectations are clear before development begins.

Project Guidance

Ethical clearance

All students must follow Falmouth University's Research Ethics Policy. In practice, this means you may need to complete the Research Ethics Approval Application Form and obtain ethical clearance before using your artefact to collect primary data, even where that data collection presents minimal risk.

If your project involves human participants (for example, playtesting a game system you have developed), or presents a significant ethical risk (for example, systems that process personal data), you will need to complete the full Research Ethics Approval Application Form, available on the Falmouth Integrity & Ethics page linked below. Discuss matters of an ethical nature with your supervisor and pay particular attention to how you address these issues in your research methodology. The ethics form should be submitted as part of the final artefact submission.

Read more about Falmouth University's Integrity and Ethics policy: falmouth.ac.uk/research/research-ethics-integrity

Project management

The major project can be a daunting prospect. Many students find it challenging because of its self-directed nature and the discipline required to sustain it. Do not worry — completing the project is intellectually liberating and a mark of your academic independence. It will provide you with something you can showcase in an interview and discuss with enthusiasm. Successful completion demands initiative, problem-solving, self-regulated learning, and planning.

A pitfall many students fall into is time management. Minimise procrastination and try to chip away at your work a little every day. Although your milestones will vary by project, the artefact should be approaching

completion by week 10 of the module. Be sure to document, organise, and reflect on your process as you go — do not underestimate the value of this.

Use appropriate project management tools including critical path analysis, Gantt charts, and burn-down charts to track your progress. Do not underestimate the importance of validation and verification: ensure sufficient time is made for quality assurance practices that demonstrate your artefact was constructed through the sound application of pipelines and processes applicable to your specialism.

If you encounter issues with time management, consult your supervisor. Also take advantage of the support services offered by the Academic Skills Team (ASK): ask.fxplus.ac.uk

FAQ

How will I be assessed?

Your proposal presentation and proposal form will be marked against the Proposal Marking Rubric. Your artefact submission and reflective video will be marked against the Artefact Marking Rubric. Assessment of the artefact is conducted primarily against the submitted work; the reflective video informs the assessor's understanding and forms the basis for written feedback.

How will I receive my feedback?

Proposal feedback will be delivered in the session and formally returned within three weeks of the proposal presentation. Artefact feedback will be returned as written comments within 15 working days of the submission deadline. There is no live viva or Q&A for the artefact component.

What do I need to submit, and where?

For the proposal: upload your completed Proposal Form to Learning Space at the time of your presentation. For the artefact: upload your .zip file (containing your artefact, process documentation, and any additional materials as specified above) and your reflective video to Learning Space by the specified deadline, no later than 4pm on the day. We recommend submitting well in advance of the deadline.

How long should the proposal presentation be?

10 minutes, with up to 5 minutes for questions. Feedback will be delivered immediately after.

How long should the reflective video be?

The standard length is 10 minutes. Additional content (walkthrough footage, demonstration video) may be required depending on your artefact type — see the artefact-type requirements above.

Who can I contact for further guidance?

Your first point of contact should be your project supervisor. You can also contact the module leader at: william.huber@falmouth.ac.uk

Can I change my project concept partway through?

Yes — it is a natural part of any project that your concept and aims will shift as the project evolves and as you receive feedback. The project you propose initially is not set in stone; allowing it to evolve is a key part of agile project management. However, caution is advised before making radical changes, especially as the final deadline draws closer. Your supervisor can advise. Note that any significant change to your artefact type or process documentation method should be discussed with and confirmed by your supervisor.

Can I use asset packs or open-source software libraries?

Yes — this is a good way of managing the scope of a complex project. However, any work that is not your own must be properly credited. You will only receive credit for your own work, so you must ensure you are adding significant value to any third-party material you use.

Use of AI tools and AI-generated material

Artificial intelligence tools — including generative AI for text, image, audio, code, and other outputs — are increasingly part of professional and creative practice in the games and creative technology industries. This module does not prohibit their use. However, their use must be transparent, purposeful, and critically reflected upon. These requirements apply to all students on all programmes.

Transparency means disclosing how AI tools have been used in your project. This disclosure should appear in your process documentation and be addressed in your reflective video. You should be specific: which tools, for what purpose, and at what stage of the project.

Purposeful application means that your use of AI tools should be a considered methodological choice, not a substitute for your own intellectual or creative contribution. You are responsible for all work submitted under your name. Where AI tools have generated content that forms part of your artefact, you must be able to demonstrate that you have exercised critical judgement over that content — selecting, evaluating, refining, and taking responsibility for it.

Critical reflection means engaging analytically with what AI use meant for your practice, your process, and the outcomes of your project. This is not a disclaimer but a genuine component of the intellectual work of the module. What did using AI enable? What did it foreclose? How did it shape your decisions?

The university's Academic Integrity Policy identifies using generative AI to produce a significant volume of content that is then submitted as your own work without acknowledgement as a form of academic misconduct. Undisclosed AI use — regardless of extent — is therefore a breach of this policy and of the principles of this module.

For students whose artefact uses AI as its primary medium or subject — for example, a trained model, a generative system, or an AI-assisted creative pipeline — the above principles remain in force, but the framing shifts. The question is not whether AI use is permissible, but how your authorial and intellectual contribution is established. In these cases, the artefact itself is evidence of your practice; the process documentation, proposal, and reflective video are where you make that contribution legible. Discuss the framing of your project's contribution with your supervisor at proposal stage.

Proposal Marking Rubric
